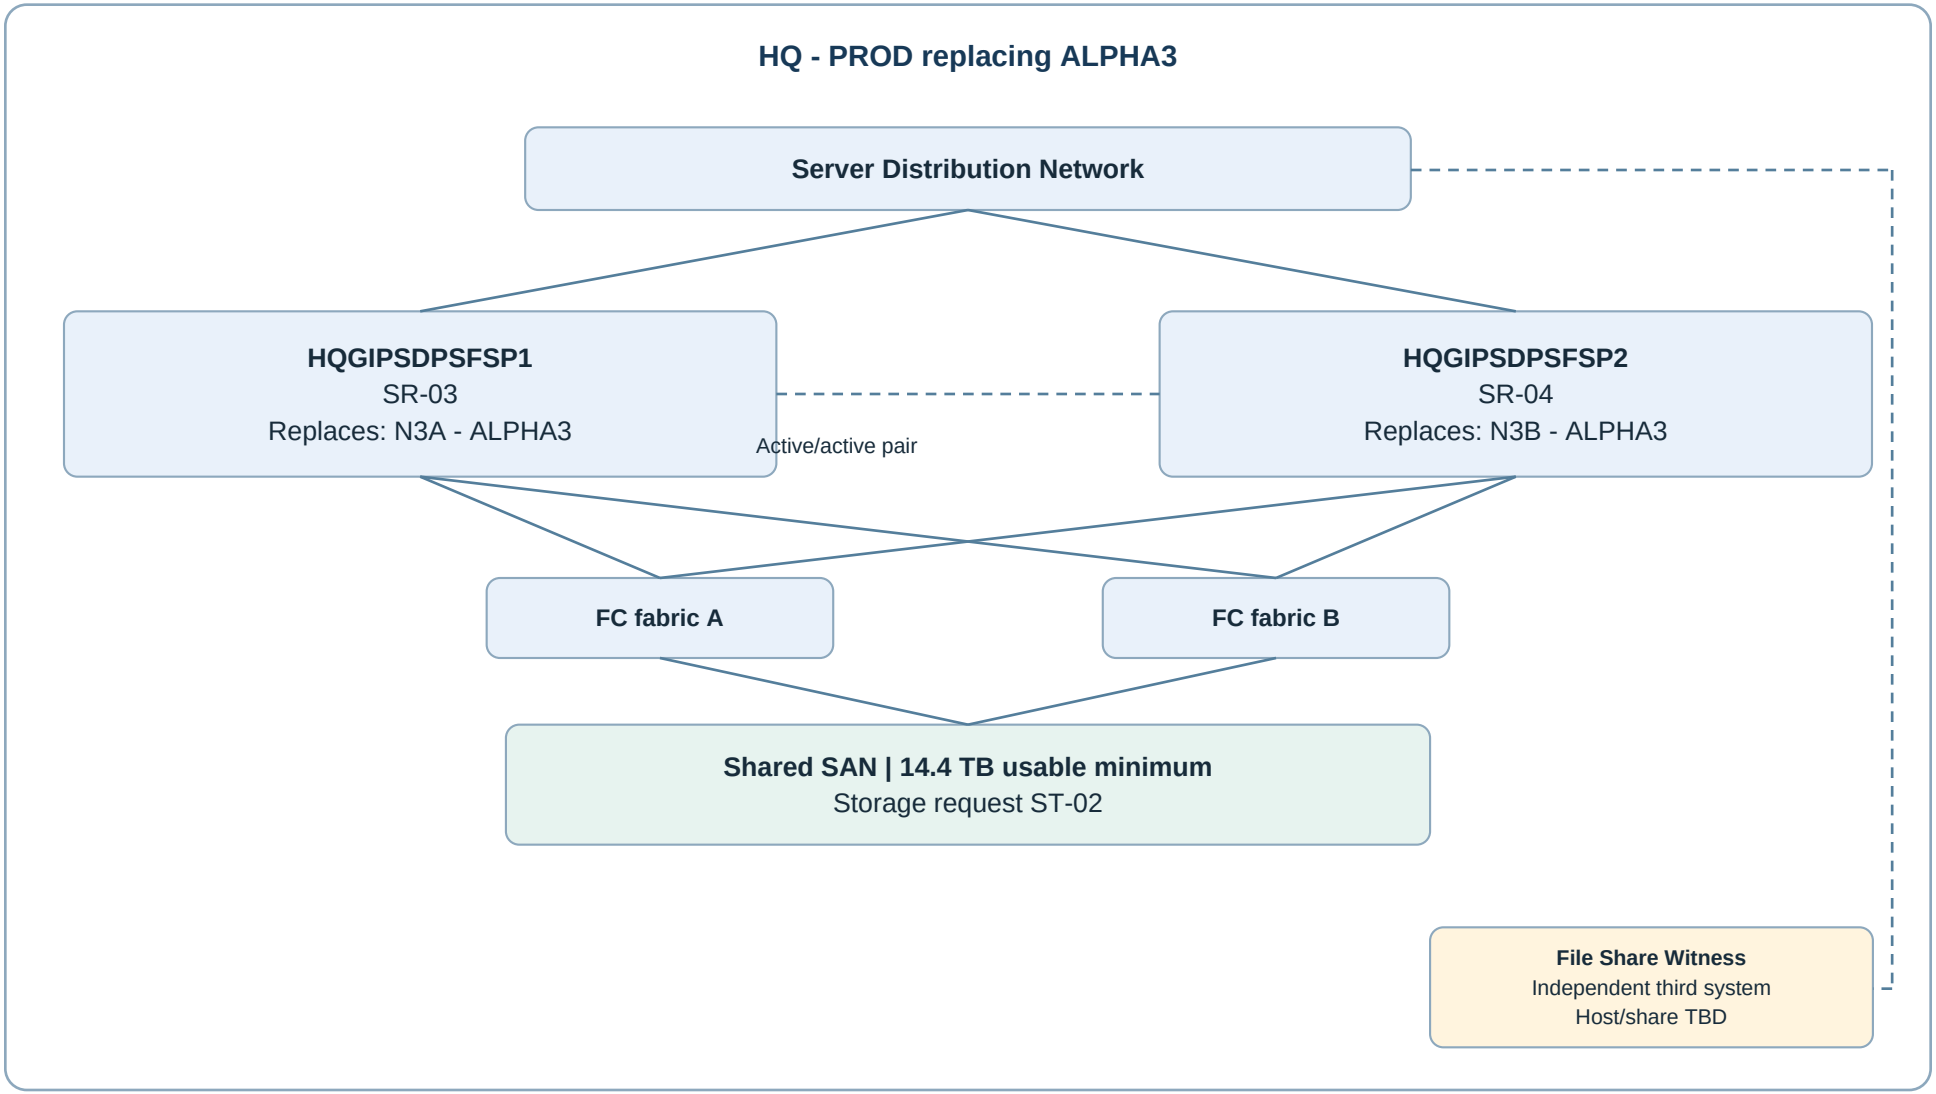
GDPS PROD Network Node Diagram

HQ | Replaces the ALPHA3 production pair one for one. The new active/active cluster provides production file services and shared SAN access, with recovery replication to IM and both CRATE clusters.



Logical connectivity. Solid lines: network/storage paths. Dashed lines: cluster pairing or witness access. Dual independent FC fabrics with Windows MPIO; redundant Server Distribution connectivity.

Witness shares are independent of cluster nodes and clustered storage. HBA models, speeds, compatibility and assigned network values require infrastructure-team confirmation.
