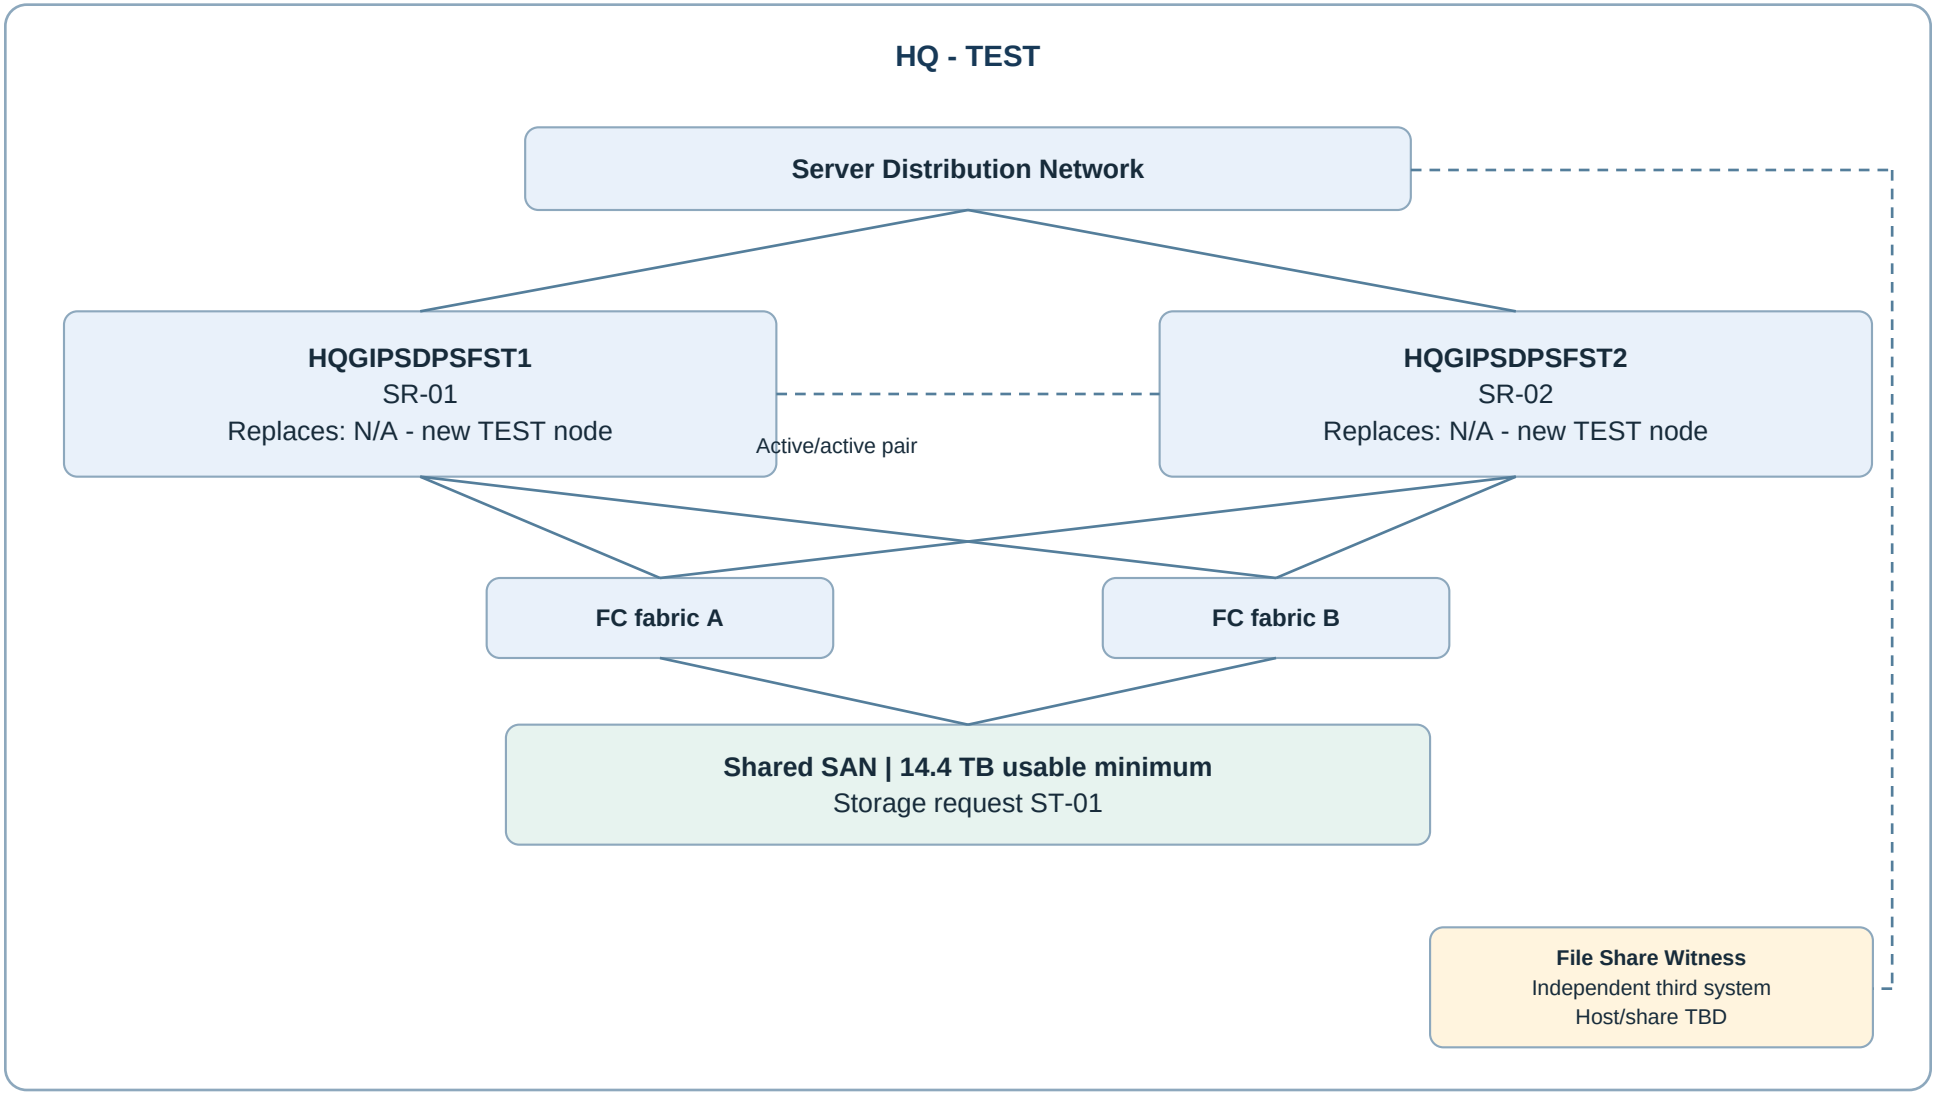
GDPS TEST Network Node Diagram

HQ | Two new physical TEST nodes reproduce the Alpha production cluster pattern to validate shared storage, clustering, failover and recovery before release. Neither node replaces an existing Alpha server.



Logical connectivity. Solid lines: network/storage paths. Dashed lines: cluster pairing or witness access. Dual independent FC fabrics with Windows MPIO; redundant Server Distribution connectivity.

Witness shares are independent of cluster nodes and clustered storage. HBA models, speeds, compatibility and assigned network values require infrastructure-team confirmation.
